

**Moebius Syndrome Awareness Day
(AKA Purple Day)**

Moebius Syndrome is a rare neurological condition involving the 6th and 7th cranial nerves in the brain. The cause is unknown. Symptoms include facial paralysis, inability to blink or move

eyes from left to right, and difficulty with speech, muscle strength, and sometimes limb differences in hands and/or feet. Her cognition is not impacted.

Addy wants you to know that she can still be happy even though she cannot show a smile on her face, and that she really wants to play with you! She likes to be silly, laugh, tell jokes, run around, talk about horses and minecraft, and play with characters. If you see her roll her eyes, don't worry, that's just how she blinks!

MSAD is used to raise awareness and spread knowledge because increasing understanding will create a more inclusive and accepting world! Questions are always welcome. And your child is invited to **wear purple** on **MONDAY JANUARY 25th** in support! Thank you!

- Brittni & Kyle Jones
